### Product Description

A trephine kit is a dental tool used to remove a cylindrical section of bone or tissue from the jaw. It includes trephine burs, specialized drills for creating circular holes in the bone. Designed for precision and efficiency, the burs are often made of high-quality materials and can be sterilized for reuse. The kit may also include surgical blades, dental suction devices, and other accessories, all organized in a case for easy storage. Crucial for dental practices in surgical procedures, it ensures precise surgeries while prioritizing patient comfort and safety.
